

Hosai Area

Heavy rain that occurs once every 1000 years or more
Estimated maximum scale

Rainfall criteria prerequisite to designation of estimated flooding areas

Saigawa River: two day total rainfall 860mm
Asanogawa River: two day total rainfall 914mm
Inland water: one hour rainfall 130mm
(Heavy rain that occurs once every 1000 years or more in general)

Estimated flooding areas due to estimated maximum scale rainfall (once every thousand years or more) for river overflow flooding and inland water flooding show the range and risk of flooding. (Previous flooding simulation results are taken into consideration for inland water flooding). In addition, areas historically flooded since 2008 or later are included.
Please note there is a potential for flooding in the areas outside the estimated areas, depending on rainfall conditions.

Legend

Symbols for evacuation

- Main evacuation center
- Designated evacuation center (indoor)
- Main highway

Dangerous points on the way to evacuation

- Underground
- Bridge, underpass

Map symbols

- Administrative boundary
- School zone (block) boundary
- Government office
- Fire station, fire brigade etc.
- Police station/ Police box
- Hospital
- Disaster radio broadcast system
- Water level observation site

Note1: School zone (block) boundaries are approximate.
Note2: The names of evacuation centers in school zones (blocks) are shown in blue.

Estimated flooding areas and maximum water level

River overflow flooding

- 5.0m~ Flooding above 2nd floor roof
- 3.0~5.0m Flooding of 2nd floor
- 0.5~3.0m Flooding up to 1st floor ceiling
- 0~0.5m Flooding up to adult knee

Inland water flooding

- 0.5m~ *Evacuation difficult due to water flow
- 0~0.5m *Areas where flooding occurred due to heavy rain in 2008 or later

Note: See P11 for the difference between river overflow flooding and inland water flooding.

Evacuation

Areas where evacuation is required (due to building collapse)

Riverbank erosion

Area where buildings may collapse due to embankment destruction

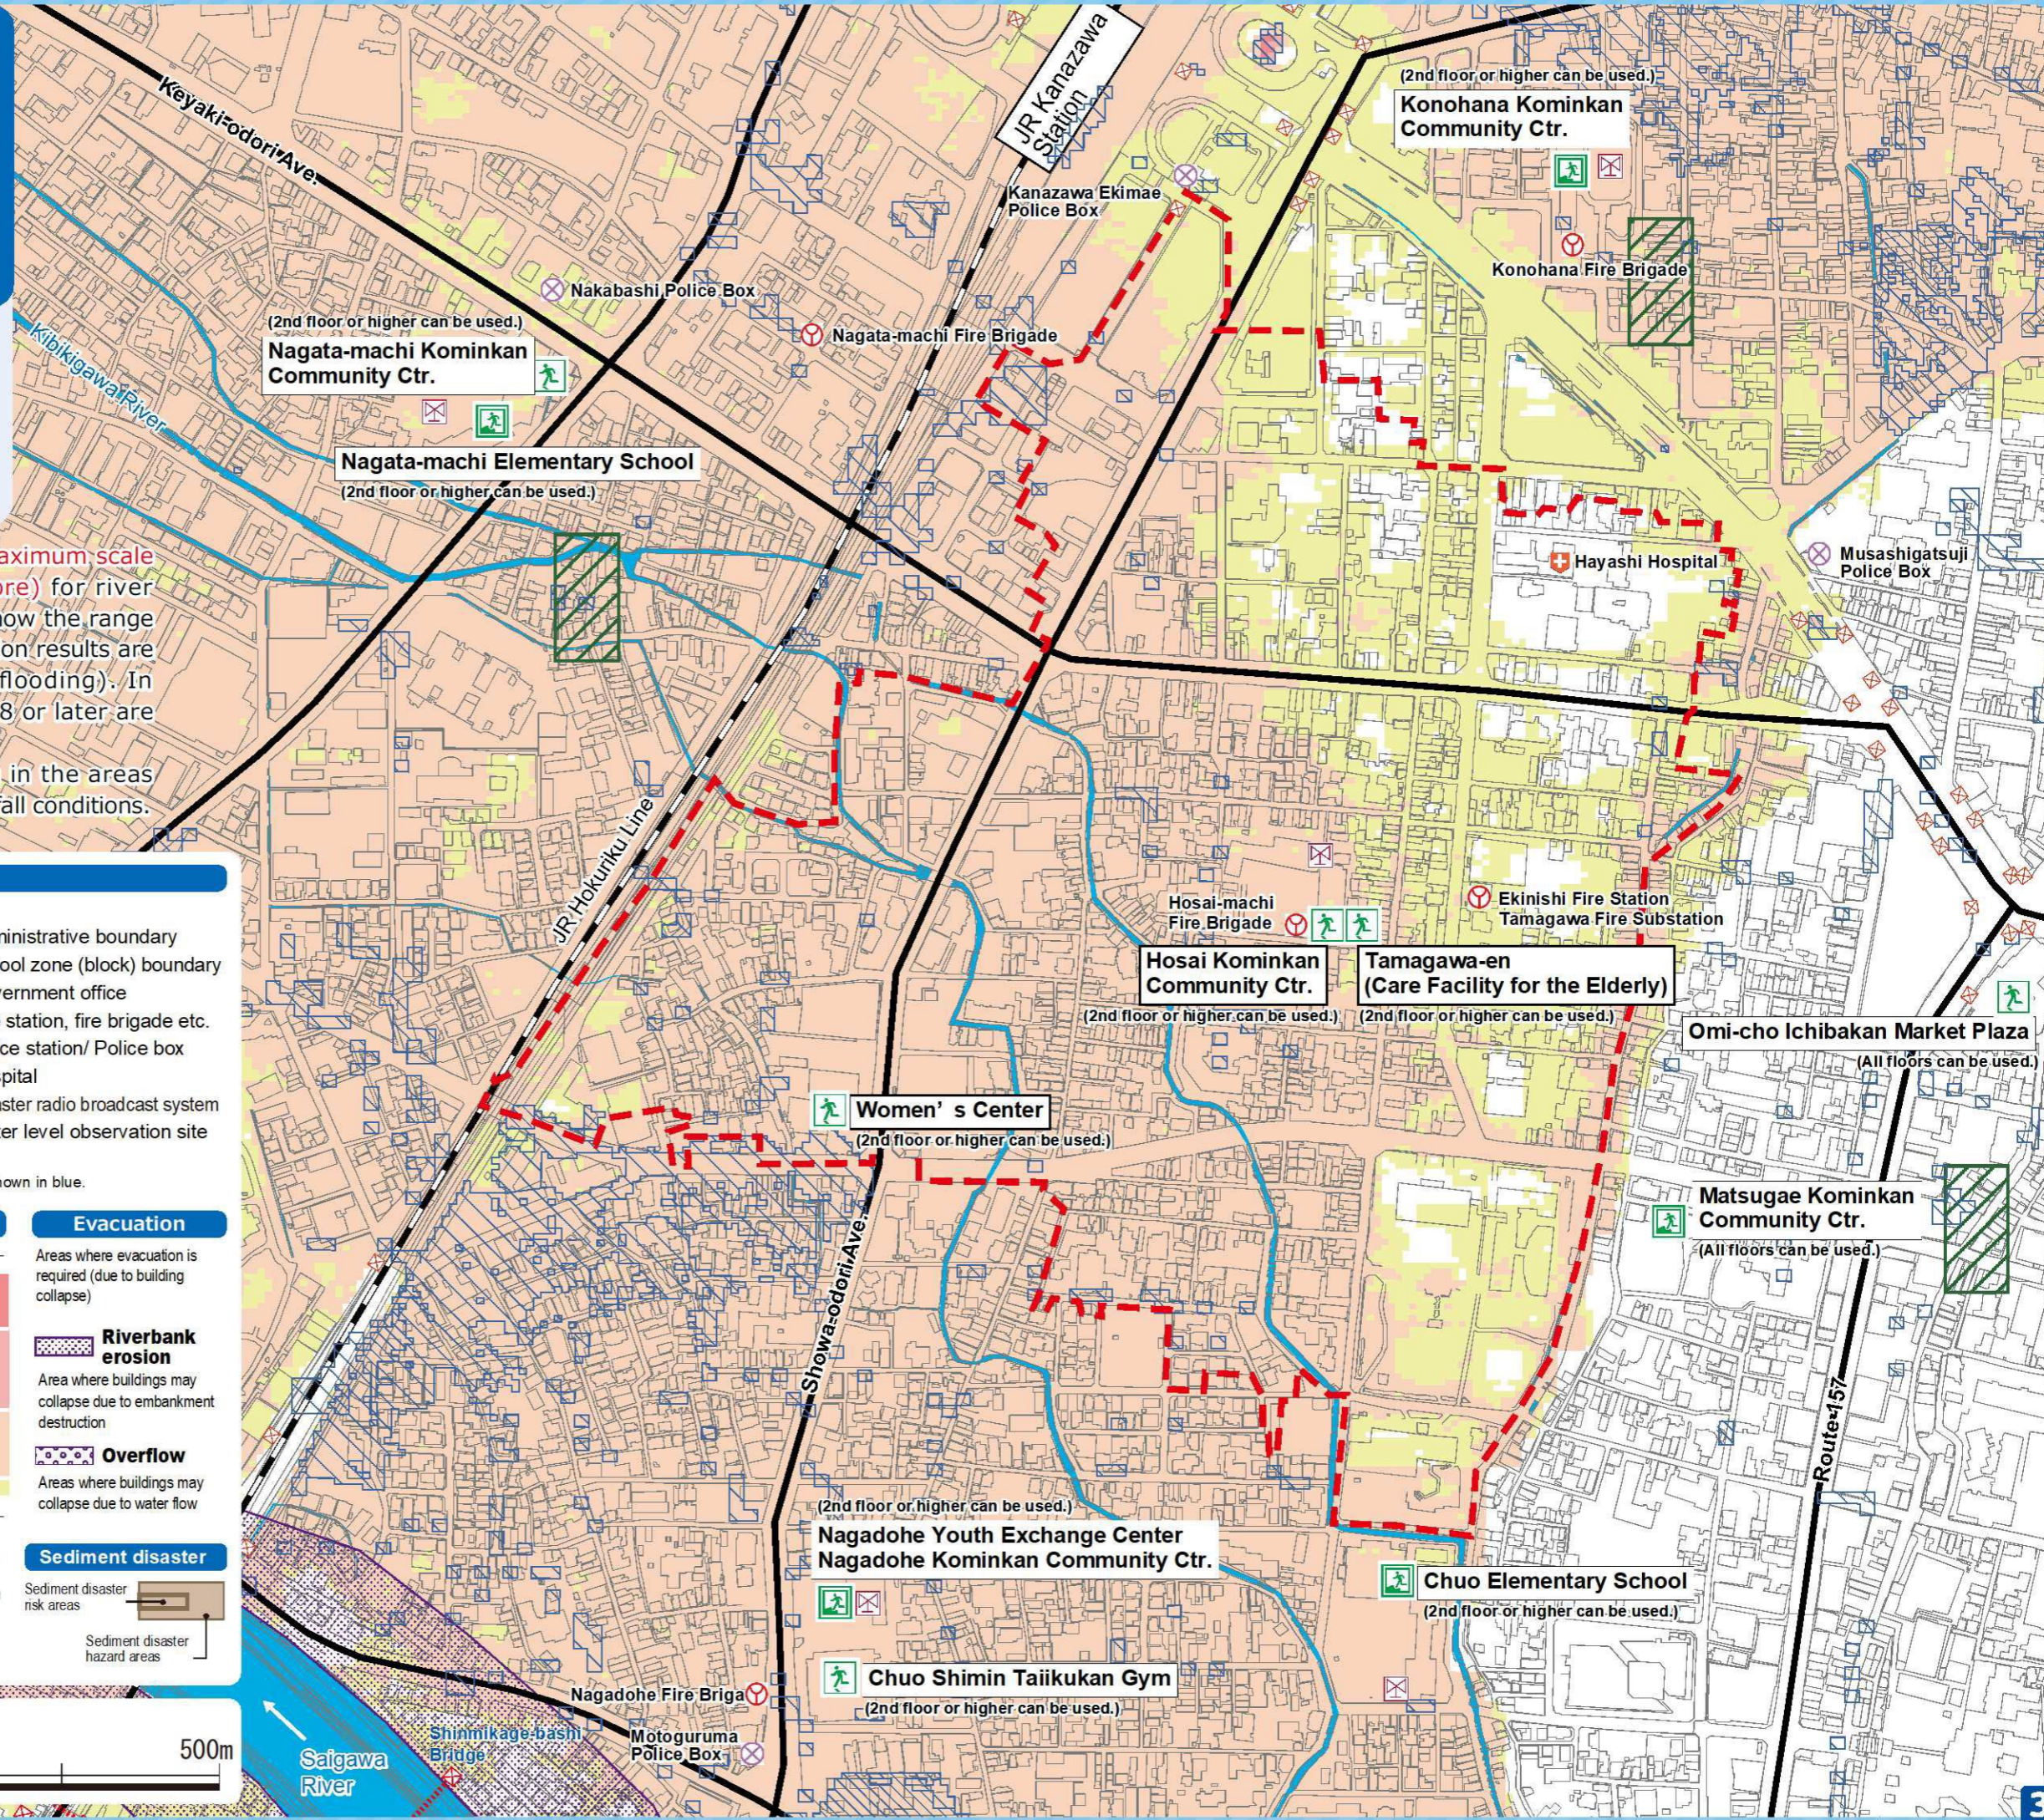

Overflow

Areas where buildings may collapse due to water flow

Sediment disaster

Sediment disaster risk areas

Sediment disaster hazard areas

Hosai Area

Heavy rain that occurs once every 100 years
(Saigawa River/ Asanogawa River)
Estimated flood scale

Rainfall criteria prerequisite to designation of estimated flooding areas

Saigawa River: two day total rainfall 314mm
Asanogawa River: two day total rainfall 256mm
(Heavy rain that, in general, occurs once every 100 years)

This hazard map shows a simulation of river overflow flooding due to heavy rain that **occurs once every 100 years (in general)**, including the range and risk of flooding.
In addition, areas historically flooded due to inland water flooding since 2008 or later are included.
Please note there is a potential for flooding in the areas outside the estimated areas, depending on rainfall conditions.
